Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. SUMMARIES

hypothetical protein APE1827 - Aeropyrum pernix (strain K1)
C;Species: Aeropyrum pernix
C;Date: 20-Aug-1999 #sequence_revision 20-Aug-1999 #text_change 20-Aug-1999
C;Accession: A72568
R;Kawarabayssi, Y.; Hino, Y.; Horikawa, H.; Yamazaki, S.; Haikawa, Y.; Jin-no, K.; Ta awa, H.; Takamiya, M.; Masuda, S.; Funahashi, T.; Tanaka, T.; Kudoh, Y.; Yamazaki, J. DNA Res. 6, 83-101, 1999
A;Title: Complete genome sequence of an aerobic hyper-thermophilic Crenarchaeon, Asro A; Reference number: A72456; MUID:99310339
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C.Accession: S73832

Studitted (FEB-1200) to the EMBL/Genbank/DDBJ databases.
-!- BUNCTION: BINDS TO THE N-TERMINAL PTS2-TYPE PEROXISONAL TARGETING
SIGNAL AND PLAYS AN ESSENTIAL ROLE IN PEROXISONAL PROTEIN IMPORT.
-!- SUBUNIT: INVERACTS WITH PEXS ( BY SIMILARITY).
-!- SUBCELLULAR LOCATION: CYTOPLASMIC (BY SIMILARITY).
-!- SIMILARITY: CONTAINS 6 WD REPEATS (TRR-ASP DOMAINS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 30-MAY-2000 (Rel. 39, Created)

collagen family located on the human chromosome 1.";

J. Biol. Chem. 266:7721-7727(1991).

-!- FUNCTION: MAJOR COMPONENT OF THE DESCEMET'S MEMBRANE (BASEMENT MEMBRANE) OF CORNEAL ENDOTHELIAL CELLS.

-!- SUBUNIT: MAY FORM HUMOTRIMERS, OR HETEROTRIMERS IN ASSOCIATION INTH ALPHA 1(VIII) TYPE COLLAGENS.

-!- PTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.

-!- SIMILARITY: STRONG, TO ALPHA 1 TYPES VIII AND X COLLAGENS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "Prediction of the coding sequences of unidentified human genes. I) the complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro.";

DNA Res. 5:31-39(1998).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo sapiens (Human).

Fretrovial protease-like gene in the vaccinia virus genome.";
Proc. Natl. Acad. Sci. U.S.A. 86:4152-4155(1989).
-!- FUNCTION: THIS ENZYME IS INVOLVED IN NUCLEOTIDE METABOLISM: IT
PRODUCES DUMP, THE IMMEDIATE PRECURSOR OF THYMIDINE NUCLEOTIDES
AND IT DECREASES THE INTRACELLULAR CONCENTRATION OF DUTP SO THAT
URACIL CANNOT BE INCORPORATED INTO DNA.
-!- CATALYTIC ACTIVITY: DUTP + H(2)0 = DUMP + PYROPHOSPHATE.
                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Variola virus.
Viruses; dsDNA viruses, no RNA stage; Poxviridae; Chordopoxvirinae;
URACIL CANNOT BE INCORPORATED INTO DNA.
CATALYTIC ACTIVITY: DUTP + H(2)0 = DUMP + PYROPHOSPHATE.
SIMILARITY: BELLONGS TO THE DUTPASE FAMILY.
CAUTION: WAS ORIGINALLY THOUGHT TO BE A PROTEASE-LIKE PROTEIN (PSEUDOPROFEASE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         venter C.J.;

PRODUCES DUMP, THE IMMEDIATE PRECURSOR OF THYMIDINE NUCLEOTIDES AND IT DESCREASES THE INTRACELLULAR CONCENTRATION OF DUTP SO THAT URACIL CANNOT BE INCOPERATED INTO DNA.
CATALYTIC ACTIVITY: DUTP + H(2)0 - DUMP + PYROPHOSPHATE.
SIMILARITY: BELONGS TO THE DUTPASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Urrutia R., Jung G., Hammer J.A. J. VIROL. THIS INAMEDIATE DECURSOR OF THYMIDINE NUCLEOTIDES
PRODUCES DUMP, THE INMEDIATE PRECURSOR OF THYMIDINE NUCLEOTIDES
AND IT DECREASES THE INTRACELLULAR CONCENTRATION OF DUTP SO THAT
INCALL CANNOT BE INCORPORATED INTO DNA (BY SIMILARITY).
J. CATALYTIC ACTIVITY: DUTP + H(2)0 = DUMP + PYROPHOSPHATE.
J. CATALYTIC ACTIVITY: DUTP + H(2)0 = DUMP + PYROPHOSPHATE.
J. SIMILARITY: BELONGS TO THE DUTPASE FAMILY.

J. SIMILARITY: BELONGS TO THE DUTPASE FAMILY.

THIS PRODUCED THYMID A COLLABOR.

RNA-DIRECTED RNA POLYMERASE SUBUNIT P1 (EC 2.7.7.48) (POLYMERASE BASIC IPROTEIN), (PB1).
Influenca virus (strain A/Fort Monmouth/1/47).
Viruses; SSRNA negative-strand viruses; Orthomyxoviridae;
Influenca virus A and B group; Influenca A viruses;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE=97033391; PubMed=8879138; MEDLINE=97033391; PubMed=8879138; Medline=97033391; PubMed=8879138; Mutations in the hemagglutinin and matrix genes of a virulent influenza virus variant, A/FM/1/47-MA, control different stages in pathogenesis: "; A/FM/1/47-MA, control different stages in pathogenesis: "; SUBUNIT: INFLUENZA RNA POLYMERASE IS COMPOSED OF THREE SUBUNITS:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NATURE 388:539-547(1997).

NATURE 388:539-547(1997).

PRODUCES ATP FROM ADP IN THE PRESENCE OF A PROTON GRADIENT ACROSS THE MEBRANE.

SUBUNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE SUBUNITS: ALPHA(3), BETA(3), GAMMA(1), DELTA(1), EPSILON(1). CF(0)

HAS THREE MAIN SUBUNITS: A, B AND C.

SIMILARITY: BELONGS TO THE ATPASE EPSILON CHAIN FAMILY.
